INSTALLATION MANUAL

Introduction:

This manual is a step-by-step explanation on how to run the provided SQL file[Masoom_Bano_102303641_DLBDSPBDM01_P3_Submission_Code_file.zip].

- *NOTE*: This guide assumes you have PostgreSQL[9.1 or later] already installed and a user account with sufficient privileges.

1. Prerequisites:

- PostgreSQL[9.1 or later] is installed and running on your system.
- Access to a PostgreSQL user account with permission to create databases and tables
- SQL file [Masoom_Bano_102303641_DLBDSPBDM01_P3_Submission_Code_file.zip] downloaded on your system.
- *NOTE*: If your system does not have PostgreSQL downloaded and installed on your system, visit on the link below to successfully complete the download and installation of PostgreSQL on your system, then follow this instruction guide.
- For MacOS: https://www.devart.com/dbforge/postgresql/how-to-install-postgresql-on-macos/
- For Windows: https://blog.devart.com/download-install-postgresql-on-windows.html
- For Ubuntu: https://www.devart.com/dbforge/postgresql/how-to-install-postgresql-on-ubuntu/

2. Contents of the [Masoom_Bano_102303641_DLBDSPBDM01_P3_Submission_Code_file.zip] file:

- This zip file contains 2 .sql files named 102303641_DLBDSPBDM01_P3_create.sql and 102303641_DLBDSPBDM01_P3_insert.sql.
- The 102303641_DLBDSPBDM01_P3_create.sql is used to create the database. It has multiple *CREATE TABLE* statements to define the schema and several *ALTER TABLE* statements to add foreign key constraints.
- The 102303641_DLBDSPBDM01_P3_insert.sql is used to insert the data into the created schema.

3. Verification of Installed PostgreSQL:

- Open a *psql* window and check PostgreSQL version by executing following commands:
- *psql --version*
- *NOTE:* If PostgreSQL is installed on your system, the commands above returns the version of installed PostgreSQL software.

4. Connection to PostgreSQL:

- Log in to your PostgreSQL using the *psql* client with a superuser or a user with sufficient privileges:
- *psql -U postgres*
- *NOTE:* Replace ‘postgres’ with your PostgreSQL username if you have a different username.

5. Executing the SQL File- 2 Different Ways:

- There are 2 different ways in which you can execute these sql files. Follow any one method mentioned below, which is most suitable for you:

I. Execute SQL File - Run Inside *psql* Interactive Shell:

- Open pgAdmin
- Create Database [airbnb_project] by right click -> Select Create -> Select Database and create the database successfully.
- Click on your database name[airbnb_project] and connect it to the server
- Go to Tools -> PSQL Tool , then follow the steps below provided in the table:

Step	Command/Action
Run SQL Create File	psql -U postgres -d airbnb_project -f /path-where-file-is-saved/ 102303641_DLBDSPBDM01_P3_create.sql
Run SQL Insert File	psql -U postgres -d airbnb_project -f /path-where-file-is-saved/ 102303641_DLBDSPBDM01_P3_insert.sql
List Tables	\dt

II. Execute SQL File - Run Using GUI Tool:

- Open pgAdmin
- Click on your database name[airbnb_project] and connect it to the server
- Go to Tools -> Query Tool
- Click the Open File icon and select 102303641_DLBDSPBDM01_P3_create.sql and click open
- The file opens with all the sql code in it, you can execute it as per you wish[one table at a time; or all the tables altogether]
- Click the Play/ Execute Script Button located on the top menu of the Query Tool screen to run or execute the file.
- Repeat Step 4 and Step 5 for 102303641_DLBDSPBDM01_P3_insert.sql and successfully run both the files.

• NOTE: The create sql file contains a CREATE DATABASE airbnb_project in comment form. The insert sql file contains 3 test-cases in comment form. To execute those in the comment form successfully, repeat Step 5. If you are not able to run these statements, make sure the '/*' from the beginning of the statement code and '*/' from the end of the code is removed. Only then will the statements execute.

6. For Other Databases:

- If you are using MYSQL, SQL SERVER or any other database, the process is similar but the commands and file syntax may differ. The provided SQL file is tailored for PostgreSQL[9.1 or later]. Please refer to the instructional manual for your respective database for clear and smooth execution.

7. Troubleshooting Tips:

Common Issues	Troubleshooting Tips
If you get a permission denied error	Make sure your user has rights to create databases and tables.
File Not Found	Ensure you have the selected the correct SQL file path.
Foreign Key Errors	If you see errors about foreign keys, make sure all referenced tables are created before the constraints are added.
Database Not Found	Make sure you have created the database, in case you have not. Please refer to the 'Executing SQL File' part from the manual and execute according to method that suits you the most.
If encountered with any other issue, please refer to this link:	*https://www.postgresql.org/docs/current/*

You are all set! You now have the database set on your system.
